

Listing of Claims

What is claimed is:

48. (Previously Presented) A data transport interface, comprising:
a transceiving unit, configured to receive and transmit data which accords with a
USB (Universal Serial Bus) specification;
a detecting unit, configured to detect the data received by the transceiving unit, to
determine whether to convert the received data into data which accords with a particular
specification; and
a conversion unit, configured to convert the received data into the data which
accords with the particular specification when determining that the received data should be
converted into the data which accords with the particular specification, and configured to
convert the transmission data which accords with the particular specification into data which
accords with the USB specification for transmission via the transceiving unit.

49. (Previously Presented) The interface of claim 48, wherein the conversion unit
comprises: an unpackaging unit, configured to unpackage the received data into the data
which accords with the particular specification.

50. (Previously Presented) The interface of claim 48, wherein the conversion unit
comprises:

 a packaging unit, configured to package the transmission data into the data which
 accords with the USB specification.

51. (Previously Presented) The interface of claim 49, wherein the conversion unit
comprises:

 a packaging unit, configured to package the transmission data into the data that
 accord with the USB specification.

52. (Previously Presented) The interface of claim 51, wherein the particular
specification is a MPEG specification.

53. (Previously Presented) The interface of claim 52, wherein the conversion unit further comprises:

a P/S conversion unit, configured to convert parallel synchronous transmission data which accords with the MPEG specification into serial asynchronous data which accords with the USB specification;

wherein the data which accords with the USB specification includes an integer multiple of packets which accord with the MPEG specification.

54. (Previously Presented) The interface of claim 53, wherein the conversion unit further comprises:

a S/P conversion unit, configured to convert the received serial asynchronous data which accords with the USB specification into parallel synchronous data which accords with the MPEG specification.

55. (Previously Presented) The interface of claim 54, wherein any one of the data which accords with the USB specification and the data which accords with the MPEG specification comprises at least one of service data and control information, the control information being used to control operations of a device equipped with the interface.

56. (Previously Presented) The interface of claim 55, wherein the service data comprises at least one of audio data and video data.

57. (Previously Presented) The interface of claim 55, wherein the control information comprises at least one of information for implementing PnP (Plug and Play) function, information on resource allocation and information on the transmission rate to be used.

58. (Previously Presented) The interface of claim 57, wherein the control information may be transmitted in a data transfer mode of at least one of bulk data transfer and interrupt data transfer in the USB specification.

59. (Previously Presented) A digital signal processing apparatus, comprising:
an interface, which includes:
a transceiving unit, configured to receive and transmit data that accords with
USB (Universal Serial Bus) specification;
a detecting unit, configured to detect the data received by the transceiving
unit, so as to determine whether to convert the received data into data which accords with a
particular specification; and
a conversion unit, configured to convert the received data into the data
which accords with the particular specification when determining that the received data
should be converted into the data which accords with the particular specification, and to
convert the transmission data which accords with the particular specification into data which
accords with the USB specification for transmission via the transceiving unit;
wherein the particular specification is a MPEG specification;
a processing unit, configured to perform at least one of playing, decrypting and
storing the signals received via the interface.

60. (Previously Presented) The digital signal processing apparatus of claim 59,
further comprising:

a RF (Radio Frequency) processing unit, configured to demodulate the RF signals
received by the digital signal processing apparatus, to transmit the demodulated signals via
the interface.

61. (Previously Presented) The digital signal processing apparatus of claim 60,
wherein the processing unit comprises:

an audio decoding unit, configured to decode audio signals received via the
interface;
a video decoding unit, configured to decode video signals received via the interface;
a playback unit, configured to play the decoded audio/video signals.

62. (Previously Presented) The digital signal processing apparatus of claim 61, further comprising:

a control unit, configured to extract a control command from the signals received via the interface;

wherein the playback unit plays the decoded audio/video signals according to the control command.

63. (Previously Presented) The digital signal processing apparatus of claim 62, wherein the RF (Radio Frequency) processing unit is further configured to transmit the control command.

64. (Withdrawn)

65. (Withdrawn)

66. (Withdrawn)

67. (Withdrawn)

68. (Previously Presented) The digital signal processing apparatus of claim 59, further comprising:

an audio decoding unit, configured to decode the audio signals received via the interface, and to provide the decoded audio signals to the playback unit for playing;

a video decoding unit, configured to decode the video signals received via the interface, and to provide the decoded video signals to the playback unit for playing.

a playback unit, configured to play the decoded audio/video signals received via the interface.

69. (Previously Presented) The digital signal processing apparatus of claim 68, further comprising:

a control unit, configured to extract a control command from the signals received via the interface;

wherein the playback unit plays the decoded audio/video signals according to the control command.

70. (Previously Presented) The digital signal processing apparatus of claim 69, wherein the control command further comprises EPG (Electronic Program Guide) information.

71. (Previously Presented) The digital signal processing apparatus of claim 59, wherein the processing unit comprises:

an acquisition unit, configured to acquire a user key;

a filtering unit, configured to filter the signals received via the interface, to obtain authorization information for a user;

a decryption unit, configured to perform decryption on the authorization information according to the user key, to obtain a de-scrambling key; and

a de-scrambling unit, configured to de-scramble the signals received via the interface according to the de-scrambling key.

72. (Previously Presented) The digital signal processing apparatus of claim 71, wherein the de-scrambling unit sends the de-scrambled signals via the interface.

73. (Previously Presented) The digital signal processing apparatus of claim 71, further comprising:

a communication interface module, configured to receive and transmit data which accords with a particular transport protocol.

74. (Previously Presented) The digital signal processing apparatus of claim 73, wherein the particular transport protocol comprises at least one of Ethernet transport protocol, Cable Modem transport protocol, SmartCard transport protocol and wireless protocol.

75. (Previously Presented) The digital signal processing apparatus of claim 73, wherein the de-scrambled signals are transmitted via the communication interface module.

76. (Previously Presented) The digital signal processing apparatus of claim 72, further comprising:

a control unit, configured to generate control information according to a user requirement;

wherein the control information may be transmitted via the interface.

77. (Previously Presented) The digital signal processing apparatus of claim 72, further comprising:

a RF (Radio Frequency) processing unit, configured to demodulate the RF signals received by the digital signal processing apparatus, to transmit the demodulated signals via the interface.

78. (Previously Presented) The digital signal processing apparatus of claim 77, further comprising:

a control unit, configured to generate control information according to a user requirement;

wherein the RF processing unit is further configured to transmit the control information.

79. (Withdrawn)

80. (Withdrawn)

81. (Withdrawn)

82. (Withdrawn)

83. (Withdrawn)

84. (Withdrawn)

85. (Withdrawn)

86. (Previously Presented) A data transfer method, comprising steps of:
receiving data which accords with a USB (Universal Serial Bus) specification;
detecting the received data to determine whether to convert the received data into
processing data which accords with a particular specification; and
converting the received data into the processing data which accords with the
particular specification after determining that the received data should be converted into the
processing data which accords with the particular specification.

87. (Previously Presented) The data transfer method of claim 86, further
comprising steps of:
converting the transmission data which accords with the particular specification into
converted data which accords with the USB specification; and
transmitting the converted data which accords with the USB specification.

88. (Previously Presented) The data transfer method of claim 87, wherein the
converting the transmission data step further comprises the step of:
packaging the transmission data into the converted data which accords with the
USB specification.

89. (Previously Presented) The data transfer method of claim 86 wherein the
particular specification is a MPEG specification.
